

# HOW TO REMOVE WARNINGS OR SOME ERRORS.

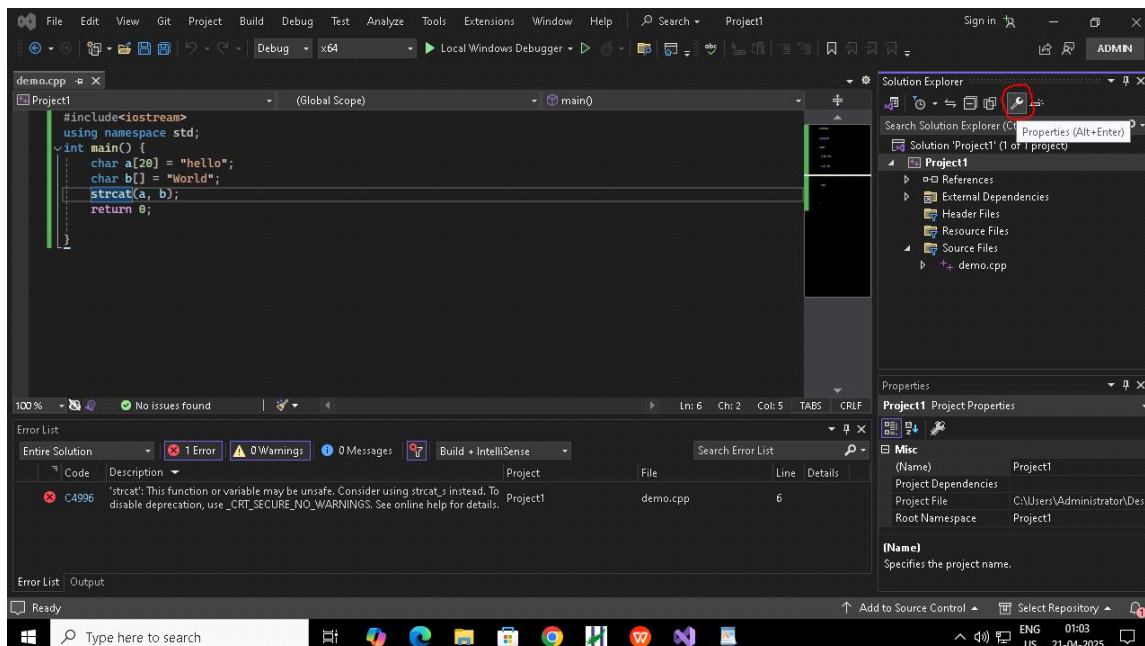

## 1. There are two steps to do this.

1.(a) As in the below code here it is showing error which is instead of `strcat` it should be given as `strcat_s`.

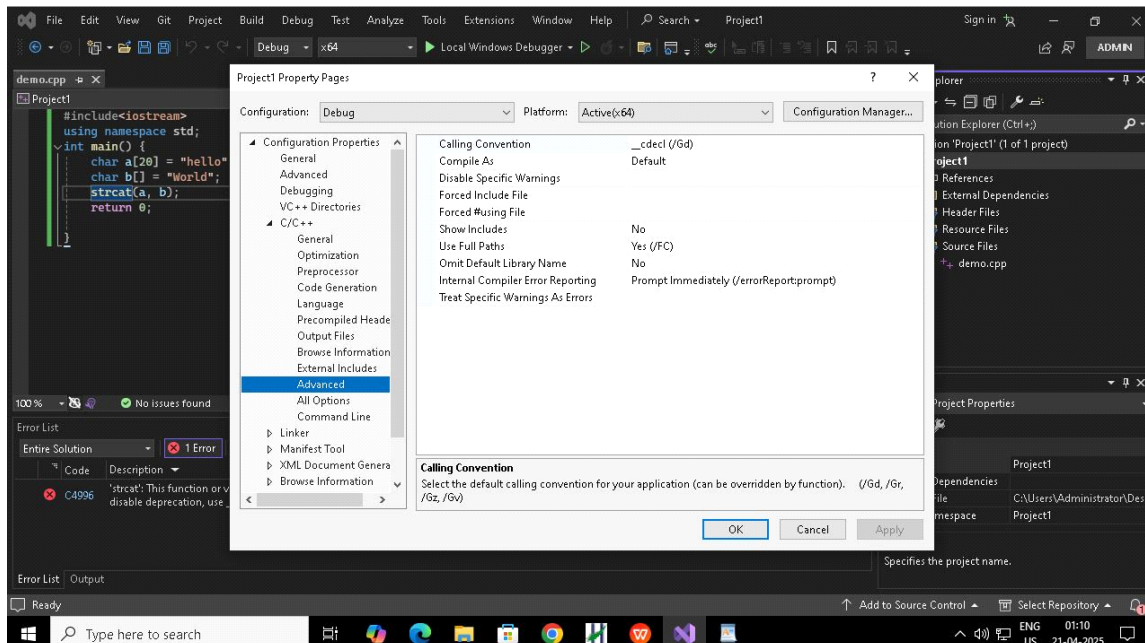

We can get rid of this error by one of the two steps

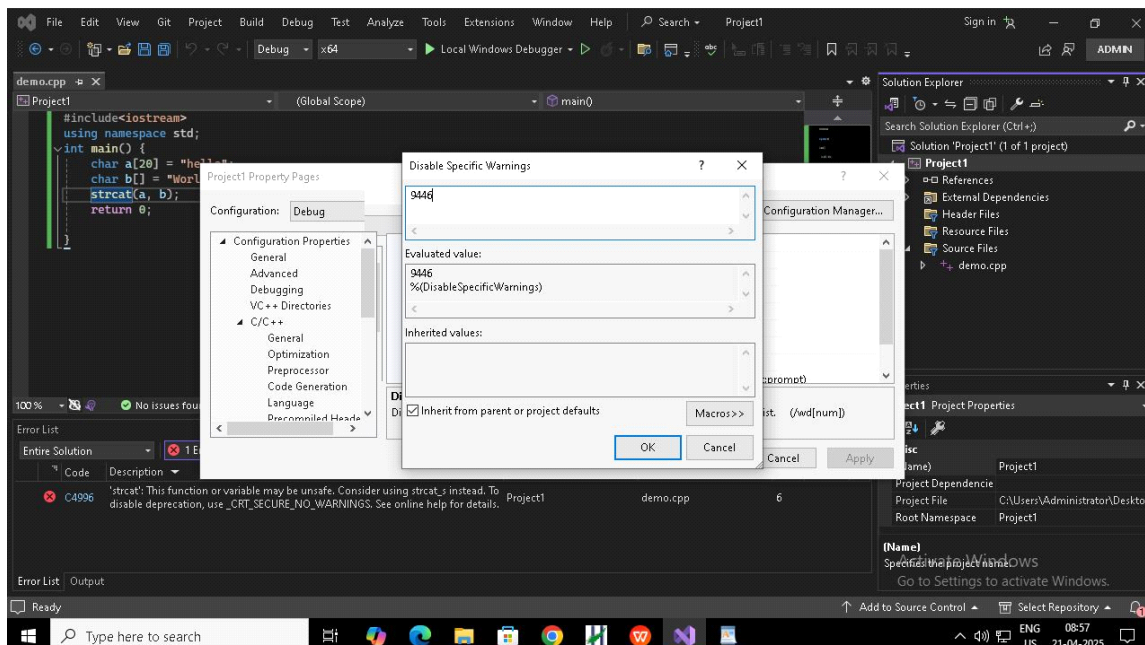

(b) First one is to "Disable specific warnings". For this go to the settings.

(c) Then a dialog box appears. In that go to C/C++. Inside that go to advanced tab and you can see some options in the dialog box.

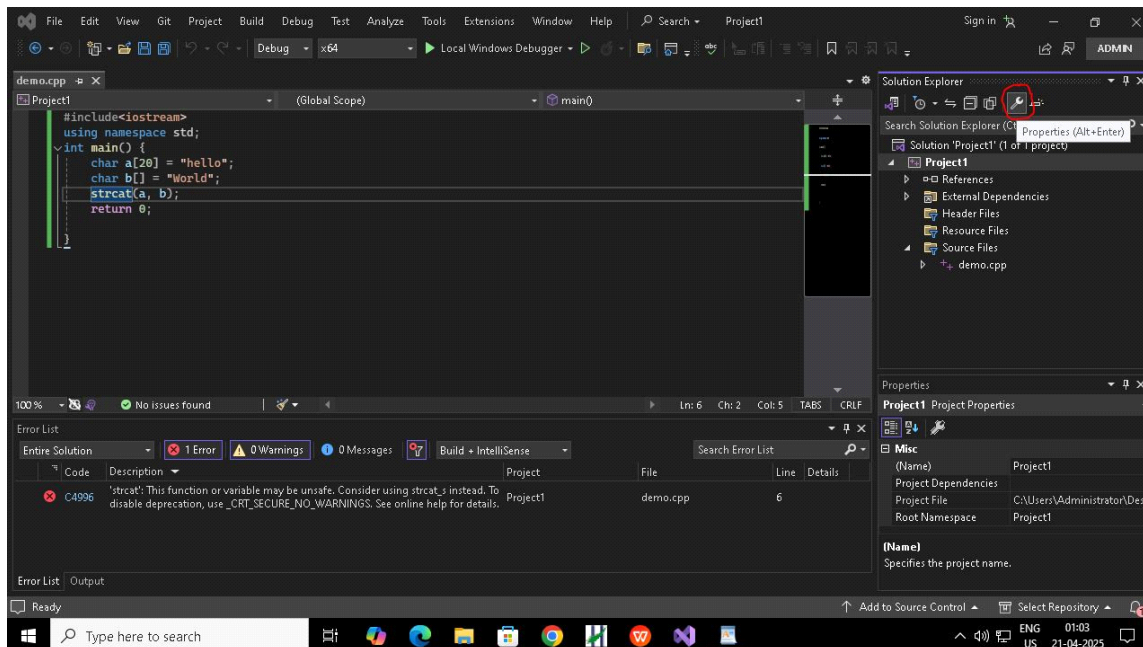

(d) Inside the box you can see a option "Disable Specific Warnings". Inside that you have to give the error number, For eg if your error no is C9446, then we have to enter the number i.e is 9446 inside the text space given in the edit option. By giving this the error will be removed.

2. Another way is to give the MACRO name in the preprocessor definitions

2.(a) For that you have to go to properties.

(b) Inside the properties we have to C/C++ tab on the left side. Inside that there is option called preprocessor click on it. The contents of this will be displayed. Inside this select the first option and there is dropdown button on the right side. Click on it and select edit.
